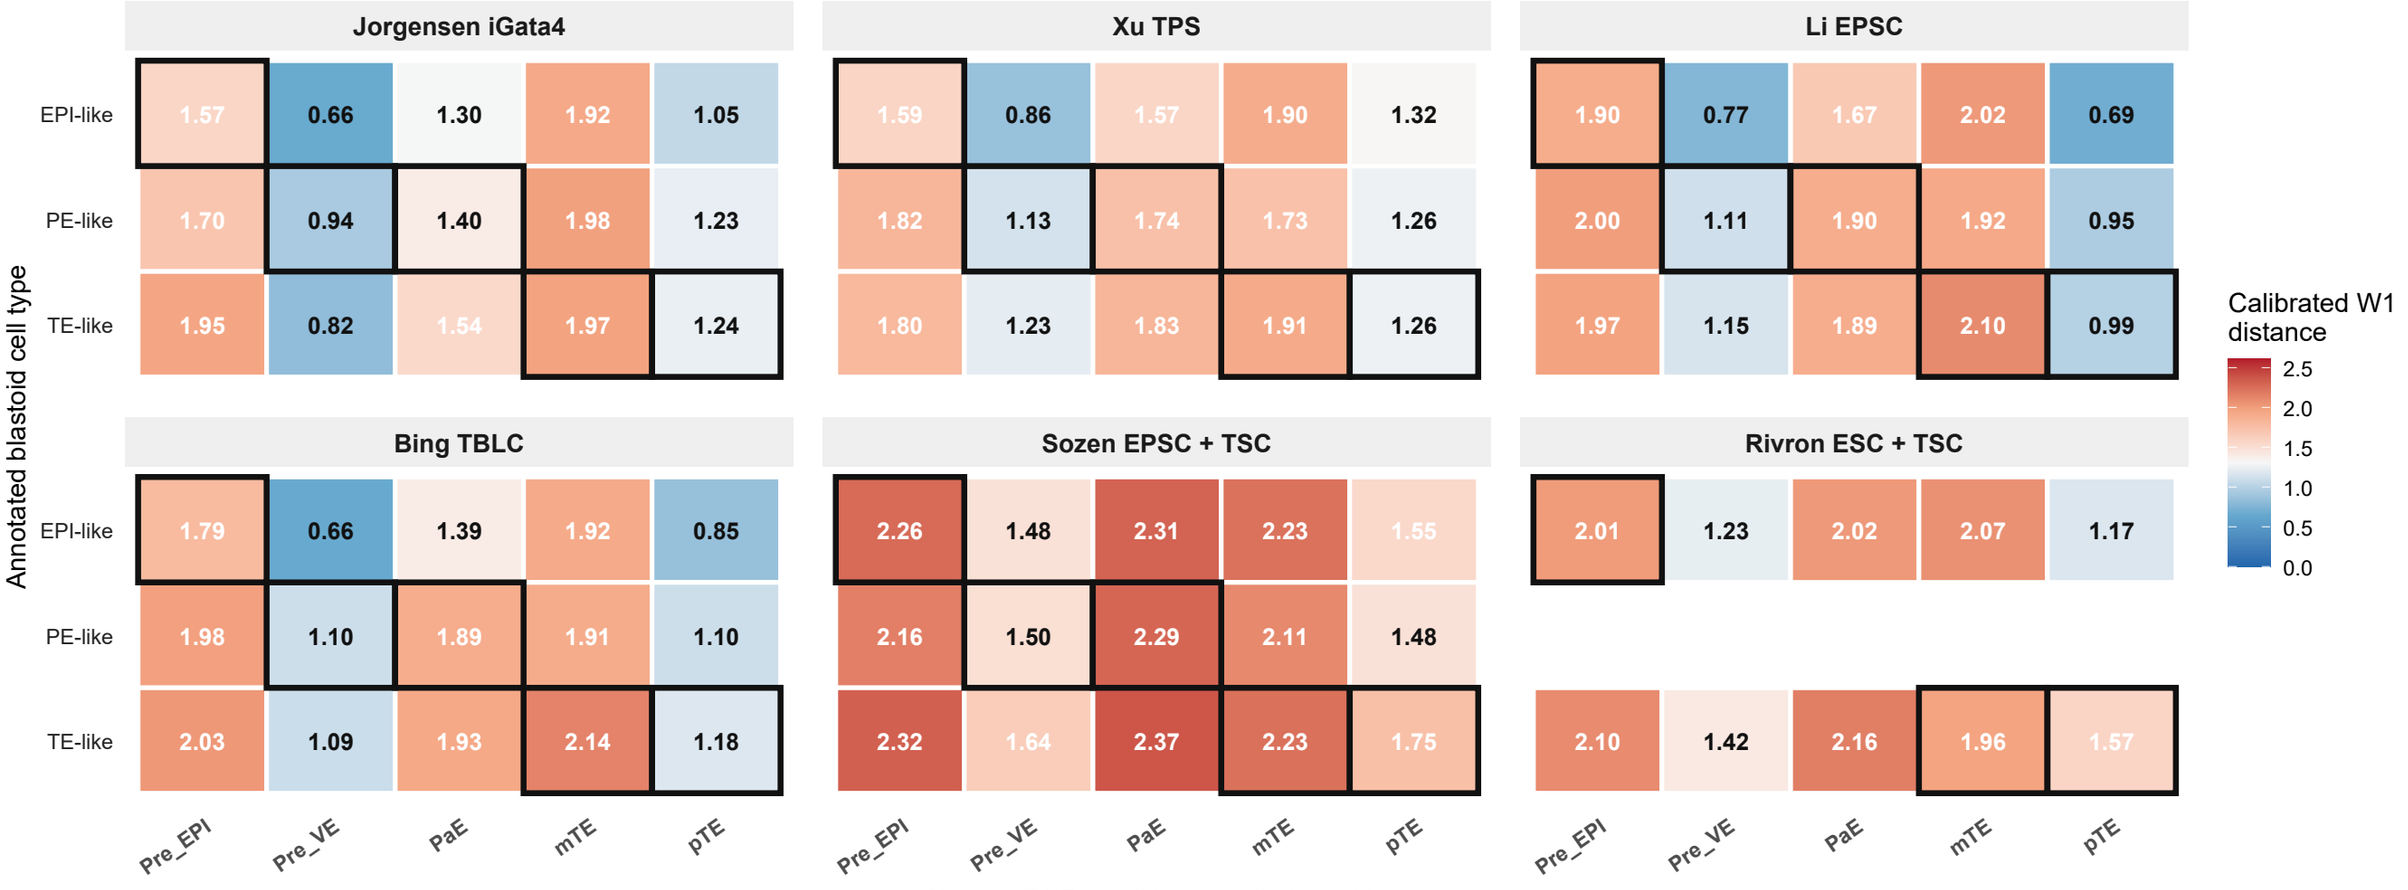
Cell-type mismatch challenge using the original sccGAN critic

Each annotated blastoid lineage is scored against all five natural E4.5 conditions; lower values indicate greater similarity



Values are robustly standardized W1 distances between blastoid and natural-calibration critic-output distributions. Black borders mark labels belonging to the annotated lineage; unbordered cells are mismatch tests.
A well condition-specific critic should show lower distances inside black borders and higher distances for cross-lineage labels. Rivron has no annotated PE-like population.
