Original sccGAN critic, calibrated to natural E4.5

The original network and critic.pth are unchanged; raw critic values are converted to condition-specific distribution distances

Violin width shows 2,000 cell-level bootstrap replicates; white dots are point estimates and bars are 95% CIs. All datasets use the same fixed-depth preprocessing and original 2,000-gene order.
PE/TE scores use the closest corresponding natural stage. The natural split is a scoring-calibration holdout, not an external model-training holdout.
